For the 8 situations in the table below, how likely is the patient to doze off or fall asleep, in contrast to feeling just tired? Even if the patient has not done some of these things recently, ask them how the situations *would have* affected them.

Use the following scale to choose the most appropriate number for each situation:

0 = Would never doze, 1 = slight chance of dozing, 2 = moderate chance of dozing, 3 = high chance of dozing. Then total the scores.
